SE Lab 2 — Agile Backlog & Sprint Plan

Project: Domain & SSL Certificate Expiry Alert System

Preparation for Jira implementation. Capture genuine Jira screenshots and replace reflection placeholders with observed sprint outcomes.

Epics

Epic	Description
E1 — Domain Monitoring	Continuously check configured domains and report domain availability/expiry risk.
E2 — SSL Certificate Monitoring	Inspect TLS certificates and identify certificates nearing expiry or invalid certificates.
E3 — Alerting & Notifications	Notify responsible users when a domain or certificate needs attention.
E4 — Configuration & Reporting	Manage monitored domains, thresholds, and review monitoring history.

User stories and estimates

ID	Epic	User story	Priority	Pts	Acceptance criteria
US-01	E1 — Domain Monitoring	As a system administrator, I want to register a domain to monitor, so that its expiry and availability can be tracked.	High	5	Create and validate a domain record; reject malformed domain names.
US-02	E1 — Domain Monitoring	As a system administrator, I want scheduled domain checks, so that expiry information stays current without manual work.	High	8	A scheduled check records timestamp and result for each enabled domain.
US-03	E1 — Domain Monitoring	As an operator, I want to see the latest domain status, so that I can identify domains needing attention.	High	3	Status includes last checked time and a readable outcome.
US-04	E2 — SSL Certificate Monitoring	As a security officer, I want to inspect a domain's TLS certificate, so that I can detect invalid or soon-to-expire certificates.	High	8	Capture issuer, validity dates, hostname match and verification result.
US-05	E2 — SSL Certificate Monitoring	As a security officer, I want configurable expiry thresholds, so that warnings arrive early enough to renew certificates.	High	5	Threshold can be configured; warning is raised when remaining validity crosses it.
US-06	E3 — Alerting & Notifications	As a domain owner, I want an alert when a domain is close to expiry, so that I can renew it before service disruption.	High	5	Alert contains domain, expiry date, remaining days and recommended action.
US-07	E3 — Alerting & Notifications	As a security officer, I want an alert for an invalid or near-expiry TLS certificate, so that I can mitigate certificate risk.	High	5	Alert is generated for invalid certificates and configurable near-expiry windows.
US-08	E3 — Alerting & Notifications	As an operator, I want duplicate alerts to be suppressed during a warning window, so that repeated checks do not flood my inbox.	Medium	5	Equivalent active alerts are deduplicated while new state changes can alert.

ID	Epic	User story	Priority	Pts	Acceptance criteria
US-09	E4 — Configuration & Reporting	As an administrator, I want to enable or disable monitoring for a domain, so that the system checks only approved targets.	Medium	3	Disabled targets are skipped by scheduled checks.
US-10	E4 — Configuration & Reporting	As an administrator, I want a history of checks and alerts, so that I can audit past monitoring outcomes.	Medium	5	Records are timestamped and filterable by domain and result.
US-11	E4 — Configuration & Reporting	As an administrator, I want input validation and access control, so that configuration changes are safe and authorized.	High	5	Invalid inputs are rejected; only authorized roles can modify configuration.

Sprint plan and reflection

Sprint 1 goal: Establish a minimum reliable monitoring path from domain registration to certificate checks and urgent alerts.

Issue	Sprint 1 item	Points
US-01	Register monitored domain	5
US-02	Schedule domain checks	8
US-04	Inspect TLS certificate	8
US-06	Alert on domain expiry	5

Planned commitment: 26 points. This is a proposed classroom estimate, not measured team velocity.

Reflection guidance

Estimations vs actual effort

Compare planned points and work completed; note stories that required unexpected investigation or integration.

Backlog prioritization

Core domain/certificate monitoring and risk alerts come first; convenience/reporting follows.

Sprint alignment

Use the actual Jira board to list completed, deferred and added work. Do not claim work was done unless the board reflects it.

Burndown insight

Describe the observed trend from Jira: steady decline, flat periods, or late drops, and what this implies for updates and estimation.

Evidence checklist: backlog with epics/stories; story points; Active Sprint board; Burndown Chart; PDF export; two completed sprints if required.
